General comments/How to improve:

"Section 1 - Alarms - 7/10

When running the program an Internal Server Error is thrown. By looking at the code, it seems that the alarms are set and cancelled correctly, however due to this error they could not be announced. The style of the code is good, you got a score of 9.31/10.

Section 2 - Smartness - 8/10

The config file was not sent, so after trying to make a similar config file to the original one, it seems that the code is able to retrieve the information from the API keys, well done. However, due to the internal server error they couldn't be announced.

Section 3 - Project delivery - 15/25

Good README file, with test cases and logging. However the config file was not sent and due to the internal server error, the web page could not be displayed."

Second marker comments (where appropriate):

Agreed mark:
